## SUMMARY

Cloud & DevOps-focused fresher with hands-on experience in Linux, Docker, CI/CD, and infrastructure monitoring, built through self-initiated projects and structured training. Comfortable learning new tools independently and working through problems methodically rather than by trial and error.

## SKILLS

**Operating Systems:** Linux (CLI, Bash scripting, file permissions, process management)  
**Cloud Platforms:** AWS (EC2, S3, IAM, CloudFront)  
**Infrastructure as Code:** Terraform, Ansible  
**Containers:** Docker, Docker Compose  
**CI/CD:** GitHub Actions, Jenkins  
**Monitoring & Observability:** Prometheus, Grafana, Loki, Alertmanager  
**Version Control:** Git, GitHub

## PROJECTS

### Self-Hosted Infrastructure — Self-Initiated Project 2026 – Present

**Tools:** Ubuntu Server, Docker, Docker Compose, Caddy, Tailscale, Cloudflare Tunnel, Prometheus, Grafana, Loki, Alertmanager, Ansible, GitHub Actions, restic, Git

- Hardened a Raspberry Pi (Ubuntu Server) with key-only SSH, disabled root login, a default-deny UFW firewall, and automatic security patching.
- Deployed containerized services with Docker Compose behind a Caddy reverse proxy; used Tailscale (WireGuard VPN) for private access and a Cloudflare Tunnel to expose one service publicly without opening router ports.
- Built a monitoring stack (Prometheus, Grafana, Loki, Alertmanager) with alert rules that notify via Telegram within minutes of a service outage.
- Automated the full deployment with an Ansible playbook and a GitHub Actions pipeline that validates configuration on every push; implemented and tested restic backups with a documented recovery runbook.
- Tracked all infrastructure configuration in Git from the first commit, maintaining a full version history of the setup.

### Application Deployment — GUVI Geek Network 2024

**Tools:** Docker, Jenkins, AWS EC2, Docker Hub, nginx, Git

- Deployed a Dockerized React app through a Jenkins pipeline with branch-based promotion to separate public (dev) and private (prod) Docker Hub repositories, and automated deployment to an AWS EC2 instance behind a least-privilege security group — rebuilt independently in 2026 from GUVI's original assignment.
- Resolved a cross-architecture build failure (ARM64 build host, amd64 deployment target) using Docker buildx with QEMU emulation.
- Ran the pipeline on the same self-hosted Raspberry Pi as the infrastructure project above, reusing existing monitoring (Uptime Kuma, Telegram alerting) instead of duplicating it.

### Automated AWS Static Website — GUVI Geek Network 2025

**Tools:** Terraform, AWS S3, CloudFront, IAM, GitHub Actions

- Provisioned AWS infrastructure (S3, CloudFront, IAM) using Terraform and automated deployments with GitHub Actions.

## INDEPENDENT LEARNING & EXPLORATION

Explored blockchain ecosystems, DeFi platforms, and decentralized applications independently, including hands-on wallet management and transactions — self-driven learning that broadened my understanding of distributed systems outside traditional cloud infrastructure. (2023 – 2026)

## TRAINING EXPERIENCE

### Machine Vision Engineer – Trainee, PNA Vision (Keyence systems, client site) Apr – Jul 2024

Assisted in setup and testing of vision-based automation systems; observed troubleshooting and real-time operational workflows on a production client site.

## CERTIFICATIONS

GUVI DevOps Certification · Soft Skill Development – NPTEL

## EDUCATION

B.Tech, Electrical and Electronics Engineering — SASTRA Deemed University, 2019 – 2023
